Data Flow: From Processing to Explainability

Discover the 6 key steps of the data pipeline, from ingestion to explainable output.

Import Data

Collect data from kaggale

Processing

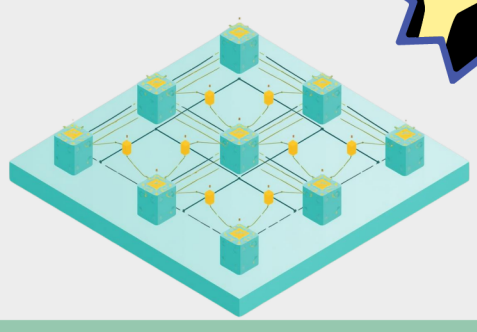
Cleaning, normalization and transformation of raw data.

Feature Engineering

Creation and selection of relevant variables for the model.

Model Evaluation

Training and validation of the machine learning model.



Explainability

Interpretation of predictions and transparency of the model.

Output

Final results, reports and visualizations for decision-making.

PIPELINE ML

Data → Processing → Feature Engineering → Model → Explainability → Output
